

E_C only ever grades cross_length —
claw_length is a free choice the loss never checks

**claw > cross
= broken design**

Ask for $E_C = 0.20$ GHz:
EVERY design on this line gets
a PERFECT loss score, but only
the green part is buildable

...but never grades claw_length,
so the model lands ANYWHERE
on the line $\rightarrow$ ~half is invalid

**claw < cross
= good design**

E_C pins cross_length exactly...

your 1,934 training designs (all valid)
